**(54) Title: METHOD AND APPARATUS FOR DETERMINING THE TEMPERATURE OF SUBTERRANEAN WELLS USING FIBER OPTIC CABLE**

**(57) Abstract:** Methods and apparatuses to determine the temperature profile of a wellbore using a fiber optic cable and an anchor are disclosed. Furthermore, a pressurized wellhead pool that couples to a standard Christmas tree structure on a well head to facilitate the injection of fiber optic cable into an oil and gas well is disclosed. The wellhead pool is portable and may be connected to fiber optic cable already located at the site, for quick connection to on-site instrumentation. A method of using the apparatuses disclosed to measure wellbore temperature at multiple depths of investigation is also disclosed.

This application claims the benefit of provisional application U.S. Ser. No. 60/315,658 filed August 29, 2001.

10 

**FIELD OF THE INVENTION**

This invention generally relates to oil and gas well logging and, more particularly, to an apparatus and method for deploying fiber optic cabling and profiling the temperature of the well using the fiber optic cable.

15

**BACKGROUND OF THE INVENTION**

Oil and gas exploration is a risky, complex task that involves sophisticated equipment and substantial financial resources. Whether on land or at sea, a search for oil and gas commences with the drilling of a well. A well may reach a depth of over a mile, or, in the case of ultraheavy rigs, may reach more than six miles in depth.

Once a well is drilled, a technique known as well logging (or wireline logging) provides valuable information about the well, specifically about the likely presence of hydrocarbons nearby. Traditionally, wireline logging was performed by lowering a measuring device known as a sonde down the well. A sonde is a metal container, usually a cylinder, which contains various instrumentation used to gather data.

The wireline sonde is lowered to the bottom of the well, at the well bore. Measurements are taken by the sonde as it is being lifted back to the surface of the well. The types of measurements taken may vary widely. Examples of measurements that may be performed include natural radiation emission, reaction to gamma ray or neutron bombardment, sonic, electrical, electromagnetic induction, resistivity, and so on.

With multiple instruments contained within, the sonde is typically heavy enough to be dropped down the well on a cable or wire. The sonde may be pulled back to the surface using a wench or a pulley.

5 Recently, fiber optic cable has been used as an alternative for obtaining valuable well data. Fiber optic cable may be advantageous because data can be transmitted at a high speed over long distances. Fiber optic cable is non-conductive and thus may be preferable to use in the well over electrical or electromechanical instruments because of the presence of explosive hydrocarbons.

10 Better yet, the measurements obtained using the fiber optic cable may be immediately transmitted up the well to a receiving system, such as a portable computer. Using techniques such as optical time domain reflectometry (OTDR), fiber optic cables have, in many cases, supplanted traditional mechanisms for obtaining data within the well  
15 bore. Transmitting fiber optic cable down a well under pressure, however, may be problematic.

Thus, there is a need for a method of delivering fiber optic cable down a well under pressure.

## 20 SUMMARY OF THE INVENTION

In accordance with the embodiments described herein, a wellhead spool is disclosed comprising a connection to a well head, a sealed spool for storing fiber optic cable to be disposed down a well bore, and an anchor coupled to the fiber optic cable, wherein the anchor  
25 is placed in an opening of the well head and the fiber optic cable is released from the spool. In one embodiment, the wellhead spool comprises a motor, preferably hydraulic, coupled to the spool to both release the fiber optic cable from and to return the fiber optic cable to the spool. In a second embodiment, the wellhead spool comprises a  
30 solvent dispersal tube to clean the fiber optic cable upon return to the spool. In a third embodiment, the wellhead spool comprises a safety valve for equalizing the pressure between the wellhead spool and the well bore.

In another aspect of the invention, a method is disclosed  
35 comprising mounting a wellhead spool providing a fiber optic cable in a sealable housing, coupling the fiber optic cable to an anchor, engaging

the sealable housing to a well head, opening a valve to the well bore, deploying the anchor and fiber optic cable into the well bore, and coupling the fiber optic cable to a measuring instrument. The method further discloses dispersing a solvent upon the fiber optic cable and engaging the anchor to a wall of the well bore.

Furthermore, in another aspect of the invention, a method and apparatus to profile the temperature of a wellbore using a fiber optic cable and an anchor is disclosed. Particularly, the apparatus and method include mounting an anchor to a fiber optic cable and deploying the combination downhole to anchor and take measurements at desired depths of investigation. More specifically, a method for measuring the temperature of a wellbore at multiple depths of investigation using a fiber optic cable and an anchor is disclosed.

25 Figure 5A is a diagram of a wireline anchor used with the wellhead spool of Figure 1 and the fiber optic cable of Figure 4 according to a preferred embodiment of the invention; and

Figure 5B is a diagram of the wireline anchor of Figure 5A in an extended position.

30

#### DETAILED DESCRIPTION

In accordance with the embodiments described herein, a wellhead spool may be employed to facilitate the injection of fiber optic or other cable into an oil and gas well. The wellhead spool is portable and may be connected to fiber optic cable already located at the site, for quick connection to on-site instrumentation. As the fiber optic cable is

spooled and unspooled, crimping of the cable and other effects known to occur when cable is wrapped around an object, is avoided

The wellhead spool may be used in a well under pressure, whether on land or in sub-sea exploration operations, and may operate with a wireline anchor to gravity-feed the fiber optic cable, if needed. The wellhead spool couples to a standard Christmas tree structure for practical operation by oilfield employees.

A wellhead spool 100, coupled to a typical Christmas tree structure 10, is depicted in Figure 1, according to one embodiment. Extending from the wellhead spool 100 are hydraulic lines 12, wash feed lines 14, and a cable feed 58. The hydraulic lines 12 and the wash feed lines 14 are coupled to a portable hydraulic pump 70 that may be situated on a vehicle, as shown. Alternatively, the lines 12 and 14 may be connected to an on-site pump, to a portable electric generator or to a different electrical power source (not shown), if available.

The cable feed 58 may be coupled to an optical time domain reflectometer (OTDR) analyzer, such as is offered by Sensa as a distributed temperature sensing (DTS) device, or to on-site fiber optic cable (not shown). The on-site fiber optic cable may already be connected to the OTDR analyzer or other instrumentation such as a laptop computer, in preparation for performing well measurements. The wellhead spool 100 conveniently provides the link between the instrumentation and the well, as described further below.

Alternatively, the wellhead spool 100 may be maintained at the site and used, as needed, to obtain well information such as temperature, resistivity, chemical characteristic of the sub-surface structure, and so on. Additional valves and/or pipes, not shown in Figure 1, may be coupled between the wellhead spool and the remainder of the Christmas tree structure 10, as is the normal practice in well maintenance.

In Figure 2, a more detailed view of the wellhead spool is depicted, according to one embodiment. The wellhead spool 100 includes spool housing 24, inside which a spool 30 of fiber optic cable 40 is maintained. The spool 30 rotates around an axle 32 which is operated by a motor 20, which may be a hydraulic motor. The spool housing 24 further includes a spool guide 54 coupled to a spool guide

track 56. The spool guide 54 moves freely along the spool guide track 56 to steer the fiber optic cable to and from the spool 30. Although depicted below the spool 30 in Figure 2, the spool guide 54 and track 56 may be positioned above the spool, in another embodiment. The fiber optic cable 40 may be held by a centralizing apparatus such as a ring, a guide, or by other methods well-known to those of skill in the art.

The hydraulic motor 20 is coupled to the hydraulic lines 12, through which hydraulic fluid is transported. The hydraulic pump 70 (see Figure 1) feeds the hydraulic fluid, typically an oil-based liquid, which then causes the hydraulic motor 20 to rotate, and, thus, the axle 32 and spool 30 to turn. Alternatively, an electric motor can be used to supply power to the wellhead spool 100.

In one embodiment, a counter 18 is connected to the hydraulic motor. The counter 18 may tally the number of rotations, the length of the fiber optic cable disposed, and so on. This allows oil field workers to reasonably ascertain the position of the fiber optic cable 40 as it is disposed down the well bore.

The wellhead spool 100 further includes a pressure gauge 16, disposed upon the top of the spool housing 24, in one embodiment. Upon engagement, the wellhead spool becomes part of the wellhead. Accordingly, the contents therein may be under high pressure. The pressure gauge 16 is a standard device for monitoring the physical condition of the well bore. On either side of the pressure gauge, a pair of lift eyes 22 are coupled to the spool housing 24, for handling of the spool 100.

The wellhead spool 100 is coupled to the Christmas tree 10 or other wellhead structure by a quick-connect flange 28, in one embodiment. In one embodiment, the quick-connect flange 28 is a type of threaded hammer union device, known to those of skill in the art. The quick-connect flange 28 is one of a number of devices, known to those familiar with oilfield exploration and maintenance, that may be used to connect the wellhead spool 100 to the Christmas tree 10.

Above the quick-connect flange 28 is a safety valve housing 66 for supporting a safety valve 26, as shown in Figure 3. Until the safety valve 26 is opened, the fiber optic cable 40 is not sent down the wellhead. Further, in one embodiment, the safety valve 26 is used to

balance the pressure from the well following installation or to prevent a high-pressure incident during removal of the wellhead spool from the well.

Extending downward in a cylindrical, then tubular arrangement, a  
5 fiber optic feed tube 68 receives the fiber optic cable 40. Upon  
engagement of the wellhead spool 100 with the Christmas tree 10, the  
fiber optic feed tube 68 forms a continuous cavity with a similar cavity in  
the Christmas tree 10 and, ultimately, with the well bore. The  
continuous cavity is the conduit through which the fiber optic cable 40 is  
10 fed down, and then back up, the well bore.

Installation of the wellhead spool 100 may occur while the well is  
under high pressure. The fiber optic feed tube 68 cavity fills with gas  
under high pressure during installation. The safety valve 26 may be  
adjusted to equalize the pressure between the well bore and the feed  
15 tube 68. Further, in one embodiment, a bleed valve 64 is used with  
safety valve 26 to adjust the pressure in the wellhead spool.

The wellhead spool 100 is installed in a manner familiar to those  
of ordinary skill in the art. For example, to install the wellhead spool  
100, a valve in the Christmas tree 10 is closed such that hydrocarbons  
20 are not released from the top of the Christmas tree 10. Then, the  
wellhead spool 100 is coupled to the Christmas tree with the safety  
valve 26 closed, according to one embodiment. Once the wellhead  
spool is successfully engaged with the Christmas tree, the valve of the  
Christmas tree 10, then the safety valve 26, are opened, allowing  
25 hydrocarbons to flow from the well bore up to the fiber optic feed tube  
68.

To remove the wellhead spool 100, in one embodiment, the  
safety valve 26 is first closed, separating the cavity of the wellhead  
spool from the well bore cavity. Also, the valve of the Christmas tree is  
30 closed, in one embodiment. Prior to removing the wellhead spool, to  
release pressure within the fiber optic feed tube 68, the bleed valve 64  
is opened, releasing pressure from the wellhead spool. The wellhead  
spool may then be removed safely.

Once pressure is balanced between the spool body and the well  
35 bore, the feed tube and the well bore are maintained at the same  
pressure, in one embodiment. Further, there is no resistance of a type

typically encountered when trying to inject a line from a low pressure orifice into a high pressure stream.

In one embodiment, the wellhead spool 100 includes a mechanism for cleaning the fiber optic cable 40 as it is being returned to the spool 30. The wash feed lines 14 that are coupled to the hydraulic pump 70 (see Figure 1) transport solvent into the wellhead spool through a pair of solvent dispersal tubes (62). A first wash feed line 14a is coupled to a left solvent dispersal tube 62a; a second wash feed line 14b is coupled to a right solvent dispersal tube 62b, as depicted in Figures 2 and 3.

In Figure 2, the left solvent dispersal tube 62a directs the solvent toward the fiber optic cable 40 from the left; simultaneously the right solvent dispersal tube 62b directs the solvent toward the fiber optic cable 40 from the right. In one embodiment, the tubes 62 are positioned just above the tubular portion, in the cylindrical portion, of the fiber optic feed tube 68. Other arrangements of the solvent dispersal tubes 62 may be made. Further, other types of solvent delivery systems may be substituted without departing from the spirit of this disclosure, many of which are well-known to those in the industry.

The solvent that is dispersed may be any of a number of well-known and readily available solvents used in the maintenance of oil field technologies. For example, trichloroethylene, isopropanol, or citrus-based solvents may be effective in cleaning the fiber optic cable 40 before it is returned to the spool 30.

The fiber optic cable 40 is depicted in Figure 4, according to one embodiment. Central to the fiber optic cable is a bundle of fibers 82, through which light may be transported. The fibers are actually very thin strands of glass, that may be surrounded by a gel filling 84. The fiber optic cable 40 further includes tubing 86, wires 88, which are usually made of steel, and a sheath 92, giving the cable more strength.

Local data such as temperature may be measured by sending quick pulses of laser light down the fiber optic cable. A weak back-scattering of the laser light occurs, which, when measured, indicates the temperature at the point of back-scattering. In one embodiment, as the fiber optic cable 40 is disposed down the well bore, analysis of the

back-scattered light spectrum is made at every meter along the fiber optic cable.

Generally, in one embodiment, pulses of light at a fixed wavelength are transmitted from the light source in surface equipment  
5 down the fiber optic line 40. At every measurement point in the line 40, light is back-scattered and returns to the surface equipment. Knowing the speed of light and the moment of arrival of the return signal, enables its point of origin along the fiber line 40 to be determined. Temperature stimulates the energy levels of the silica molecules in the fiber line 40.  
10 The back-scattered light contains upshifted and downshifted wavebands (such as the Stokes Raman and Anti-Stokes Raman portions of the back-scattered spectrum) which can be analyzed to determine the temperature at origin. In this way the temperature of each of the responding measurement points in the fiber line 40 can be calculated by  
15 the equipment, providing a complete temperature profile along the length of the fiber line 40. This general fiber optic distributed temperature system and technique is known in the prior art.

In one embodiment, part of the gel filling 84 is displaced by a gas tube 90. The gas tube allows a gas, such as nitrogen, to be transmitted  
20 through the fiber optic cable, for operating the wireline anchor 50, described in more detail, below. Although a single gas tube 90 is depicted in Figure 4, the fiber optic cable 40 can include multiple gas tubes. With its many components and layers, the fiber optic cable is built for durability. However, in some prior art applications, the fiber  
25 optic cable may become crimped, such as when the cable is wrapped around an apparatus at an acute angle. As with a phone cord, over time, the fiber optic cable may become unwieldy in its use, as the crimping may, for example, impair the ability of the cable to be disposed down a well bore.

30 In some applications, therefore, the wellhead spool 100 may be preferred. The fiber optic cable 40 is unspooled from the spool and sent down the well bore in a substantially vertical direction downward. The likelihood that the fiber optic cable will become crimped is diminished, in some embodiments. Upon completion of the measurement operation,  
35 the fiber optic cable is then respoiled on to the spool, where the cable is essentially stored until needed for a subsequent operation.

In prior art systems for obtaining well bore data using a sonde, the one or more instruments packed within the sonde provided some weight. Typically, the weight was sufficient such that the sonde could be disposed within the well bore using only gravity. Where the instruments were not sufficiently weighty, the sonde itself could be weighted to achieve this effect.

With fiber optic cable, however, no natural weighted element is present. Furthermore, many wells include hydrocarbons under pressure, making the insertion of fiber optic cable within problematic. Thus, according to one embodiment, a wireline anchor 50, as depicted in Figures 5A and 5B, may be connected to the fiber optic cable 40 before the cable is disposed down the well bore.

In one embodiment, the fiber optic cable 40, wrapped about the spool 30 of the wellhead spool 100, is extended down the fiber optic feed tube 68 and coupled to the wireline anchor 50. Accordingly, before installation, the wireline anchor 50 occupies a portion of the fiber optic feed tube 68. Then, the wireline anchor 50 is coupled to the fiber optic cable 40. Where the wireline anchor 50 is longer than the cavity (the fiber optic feed tube 68) of the wellhead spool 100, a short pipe may be inserted between the safety valve and the spool to permit the anchor to be enclosed with the fiber optic cabling prior to engagement with the Christmas tree 10.

The wireline anchor 50, therefore, is of a size sufficiently small to be disposed within the wellhead spool 100 and down the cavity of the Christmas tree 10. In one embodiment, the wireline anchor 50 is a cylindrical device composed principally of a non-corrosive metal, such as titanium. However, the anchor may be constructed of other metal, plastic, or composite materials, as the anchor typically does not stay in the well bore for an extended period of time.

In Figure 5A, the wireline anchor 50 is shown in its retracted state. This is the state the anchor will be in as it is disposed down the well bore. In one embodiment, the wireline anchor may additionally assume an extended state, as depicted in Figure 5B, such that the anchor may be affixed to the well wall, such as when the fiber optic cable 40 has reached the desired depth.

In one preferred embodiment, the wireline anchor 50 comprises a feed tube 34, a spring assembly 60, and a weight 52, as illustrated. The feed tube 34 receives the fiber optic cable 40. At the bottom of the feed tube is a cable connector 36. The cable connector 36 secures the fiber optic cable 40 to the wireline anchor, ensuring that the two do not separate during the trek down the well bore. The cable connector 36 may be any of a variety of securing means, such as a bolt, a clamp, or a fastener.

The spring assembly 60 comprises a spring 38, a piston 72, extension rods 44, rod housing 48, and wall engagement members, according to one embodiment. The piston 72 comprises a rod portion 42 and a head portion 74. The piston rod 42 extends through the center of the rod housing 48, parallel to the body of the wireline anchor 50. The piston head 74 is orthogonal to the piston rod 42, close to the cable connector 36.

In one embodiment, the wireline anchor 50 is cylindrical in shape. Accordingly, the piston head 74 of the anchor is a circular piece which extends a full 360 degrees along the wall of the spring assembly to allow arrangement of a dynamic sealing O-ring 78 formed in the lateral edge of the piston head. The sealing arrangement ensures that, between the cable connector 36 and the piston head 74, the cylinder bore 94 is a leak-proof cavity.

The spring 38 wraps around the piston rod 42, just below the piston head 74 and above the rod housing 48. The spring 38 is composed of a material that will allow repeated deformation and restoration of the spring 38. This allows the piston 72 to move up and down when a gas is injected into the cylinder bore 94 through the gas tube 90 (see Figure 4) of the fiber optic cable 40.

Below the piston 72, two pairs of extension rods 44 are disposed, in parallel. A left top extension rod 44a is coupled to a left bottom extension rod 44b by a left wall engagement member 46a. Likewise, a right top extension rod 44c is coupled to a right bottom extension rod 44d by a right wall engagement member 46b, as shown.

The left and right bottom extension rods 44b and 44d are secured to a pair of hinges 76a and 76b. The hinges 76a and 76b affix the bottom of the extension rods 44b and 44d to the rod housing 48. The

top of the extension rods 44b and 44d are affixed, by hinges 76f and 76h, respectively, to the wall engagement members 46.

Hinges 76c and 76d likewise affix the top of the extension rods 44a and 44c to the rod housing 48. The bottom of the extension rods 44a and 44c are affixed, by hinges 76e and 76g, respectively, to the wall engagement members 46.

The hinged connections of the extension rods 44 enable them to be mobile. When a gaseous material is injected into the wireline anchor 50 through the gas tube 90, the piston 72 moves downward until the spring 38 is maximally depressed, as shown in Figure 5B. The extension rods 44, in turn, move such that hinges 76c and 76d move closer to hinges 76a and 76b, causing the wall engagement members 46 to move laterally. When the wireline anchor 50 is in the well bore, the gas injection causes the wall engagement members 46 to press against the wall of the well bore, according to one embodiment.

The ability to engage the wireline anchor 50 to the wall of the well bore may be useful during data gathering operations. As the wellhead spool 100 is sending the fiber optic cable 40 down the well bore, the wireline anchor 50 may be engaged with the wall of the well bore at different points. The counter 18 may be used to keep track of approximately where in the well bore the wireline anchor is disposed.

Anchor 50 can also be activated and deactivated through other means not utilizing the gas tube 90. Particularly, in an alternative embodiment, optical energy can be sent through the fibers 82 (or another light conduit) to activate anchor 50 beneath the surface. In this configuration, anchor 50 would include a photovoltaic cell that would convert the light energy to electrical energy to extend or retract anchor 50.

Additionally, in another embodiment, at least one pressure pulse (a pressure signal with a given amplitude and duration) may be sent through the wellbore fluids from the surface, and anchor 50 may include a pressure transducer that enables and commands the extension or retraction the anchor 50 only upon recognition of a given set of pulses. . In another embodiment, anchor 50 may be configured to be activated by a series of rupture discs. Using such a configuration, the wellbore fluid pressure is increased at the surface, and the discs are adapted to

rupture at pre-determined pressures to activate or deactivate anchor 50. In this configuration, one rupture disc would preferably be designed to extend anchor 50 at one pressure and a second disc would be designed to rupture and retract anchor 50 at a second, elevated, pressure. As would be commonly understood by those skilled in the art, the rupture discs could be replaced by shear pins or the like.

Furthermore, collar stops, nipple profiles, muleshoes, or other mechanical landing devices may be disposed within the wellbore or production tubing to actuate anchor 50. These mechanical landing devices would also index fiber optic cable 40 and anchor 50 in desired measurement positions and activate anchor 50 mechanically with their profiles. Alternatively, a timer device may be disposed within anchor 50 to extend and retract anchor 50 at known time intervals. Using this system, an operator would position the anchor 50 on the fiber optic cable 40 at the desired measuring points during the pre-determined intervals.

Wellhead spool 100 may be deployed in sub-sea wells. The wellhead spool 100 may be installed upon the well head by divers or may be engaged using robotics, mechanical equipment, or using other means familiar to those of ordinary skill in the art. On-site fiber optic cable, that is, fiber optic cable that is connected to instrumentation at the well site, may be coupled to the wellhead spool, at the cable feed 58 (see Figure 2), either prior to or following deployment below the surface of the water.

Finally, it is an aspect of the invention that the wellbore temperature profiling system and method is feasible without the use of a wellhead spool 100 as shown in Figures 1 and 2. An anchor may be disposed upon a fiber optic cable and raised and lowered into position within a wellbore to take temperature profile measurements in accordance with the present invention. It is also important to note that such temperature measurements can be made whether or not the particular wellbore in question is producing (hydrocarbons flowing) at the time of measurement.

While the invention has been described with respect to a limited number of embodiments, those skilled in the art will appreciate numerous modifications and variations therefrom. It is intended that the

appended claims cover all such modifications and variations as fall within the true spirit and scope of the invention.

## What is claimed:

- 1 1. A wellhead spool comprising:  
2 a connection to a wellhead;  
3 a sealed spool for storing fiber optic cable to be disposed down a  
4 wellbore; and  
5 an anchor coupled to the fiber optic cable, wherein the anchor is  
6 placed in an opening of the well head, and the fiber optic  
7 cable is released from the spool.
- 1 2. The wellhead spool of claim 1, further comprising a motor  
2 coupled to the spool to both release the fiber optic cable from and to  
3 return the fiber optic cable to the spool.
- 1 3. The wellhead spool of claim 2, wherein the motor is hydraulically  
2 driven.
- 1 4. The wellhead spool of claim 2, further comprising a counter  
2 coupled to the motor.
- 1 5. The wellhead spool of claim 4, wherein the counter tallies a  
2 number of rotations of the spool.
- 1 6. The wellhead spool of claim 4, wherein the counter tallies a  
2 length of the fiber optic cable.
- 1 7. The wellhead spool of claim 1, further comprising a solvent  
2 dispersal tube to clean the fiber optic cable upon return to the spool.
- 1 8. The wellhead spool of claim 1, further comprising a cable feed for  
2 coupling the fiber optic cable in the spool to other fiber optic cable.
- 1 9. The wellhead spool of claim 1, wherein the fiber optic cable  
2 enters the well bore vertically.

- 1 10. The wellhead spool of claim 1, further comprising a safety valve  
2 for coupling a cavity within the wellhead spool to the well bore, wherein  
3 the cavity attains a pressure of the well bore when the safety valve is  
4 opened.
- 1 11. The wellhead spool of claim 10, further comprising a bleed valve  
2 disposed on the wellhead spool to adjust the pressure of the cavity.
- 1 12. The wellhead spool of claim 1, wherein the fiber optic cable  
2 further includes at least one gas tube for operating the anchor.
- 1 13. The wellhead spool of claim 12, wherein the anchor further  
2 comprises:  
3 a piston coupled to a wall engagement mechanism; and  
4 a weight.
- 1 14. The wellhead spool of claim 1, wherein the anchor is remotely  
2 selectively engageable to a wall of the wellbore.
- 1 15. The wellhead spool of claim 1, wherein the wellhead is a subsea  
2 wellhead.
- 1 16. An apparatus to determine the temperature of a wellbore  
2 comprising:  
3 a fiber optic cable to be disposed down the wellbore;  
4 an anchor coupled to the fiber optic cable;  
5 wherein the anchor is selectively engageable to a wall of the  
6 wellbore; and  
7 wherein the fiber optic cable is adapted to measure the  
8 temperature along the length of the cable.
- 1 17. The apparatus of claim 16 further comprising a spool to store and  
2 dispense the fiber optic cable down the wellbore.

- 1 18. The apparatus of claim 17 wherein the spool is encapsulated  
2 within a compartment that is in communication with the wellbore.
- 1 19. The apparatus of claim 16 wherein the anchor is remotely  
2 selectively expandable to engage a wall of the wellbore.
- 1 20. The apparatus of claim 18 wherein the wellhead is a sub-sea  
2 wellhead.
- 1 21. The apparatus of claim 16 wherein the anchor has a retracted  
2 position and an extended position.
- 1 22. The apparatus of claim 21 wherein the anchor engages the  
2 wellbore and resists movement when in the extended position.
- 1 23. The apparatus of claim 21 wherein optical energy in combination  
2 with a photovoltaic cell is used to actuate the anchor from the retracted  
3 position to the extended position.
- 1 24. The apparatus of claim 21 further comprising a fluid conduit  
2 extending from the wellhead to the anchor.
- 1 25. The apparatus of claim 24 wherein the anchor includes a piston,  
2 the piston connected to an extension mechanism, the extension  
3 mechanism configured to actuate the anchor from the retracted position  
4 into the extended position when the pressure of a working fluid is  
5 increased in the fluid conduit.
- 1 26. The apparatus of claim 21 wherein the anchor includes a first  
2 rupture disc, the rupture disc configured to rupture and place the anchor  
3 in the extended position when a first predetermined pressure is  
4 achieved in the wellbore.

- 1 27. The apparatus of claim 26 wherein the anchor further includes a  
2 second rupture disc, the second rupture disc configured to rupture and  
3 place the anchor in the retracted position when a second predetermined  
4 pressure is achieved in the wellbore.
- 1 28. The apparatus of claim 21 wherein the anchor is actuated from  
2 the retracted position to the extended position by a mechanical profile  
3 located within the wellbore.
- 1 29. The apparatus of claim 28 wherein the mechanical profile is  
2 selected from the group consisting of nipple profiles, collar stops, and  
3 muleshoes.
- 1 30. The apparatus of claim 21 wherein the anchor further includes a  
2 timer, said timer configured to actuate the anchor from the retracted  
3 position to the extended position at a predetermined time interval.
- 1 31. The apparatus of claim 21 wherein the anchor further includes a  
2 pressure transducer and the anchor is retracted or extended when a  
3 given pressure signal is received by the pressure transducer.
- 1 32. A method comprising:  
2 mounting a wellhead spool in a sealable housing, the spool  
3 providing a fiber optic cable;  
4 coupling the fiber optic cable to an anchor;  
5 engaging the sealable housing to a wellhead of a well;  
6 opening a valve to a wellbore of the well;  
7 deploying the anchor and the fiber optic cable into the well bore;  
8 and  
9 coupling the fiber optic cable to a measuring instrument.
- 1 33. The method of claim 32, further comprising engaging the anchor  
2 to a wall of the well bore.

- 1 34. The method of claim 32, further comprising opening a safety  
2 valve to equalize a pressure between the sealable housing and the well  
3 bore.
- 1 35. The method of claim 34, further comprising opening a second  
2 valve to adjust the pressure in the sealable housing.
- 1 36. The method of claim 32, further comprising closing a safety valve  
2 to stop the flow of hydrocarbons to the sealable housing from the well  
3 bore.
- 1 37. The method of claim 36, further comprising opening a second  
2 valve to adjust the pressure in the sealable housing.
- 1 38. The method of claim 32, further comprising:  
2 connecting the wellhead spool to a motor; and  
3 operating the motor to wind and unwind the wellhead spool.
- 1 39. The method of claim 38, further comprising:  
2 returning the fiber optic cable to the wellhead spool; and  
3 removing the wellhead spool from the well head.
- 1 40. The method of claim 32, further comprising dispersing a solvent  
2 upon the fiber optic cable.
- 1 41. A method for determining the temperature of a wellbore, the  
2 method comprising:  
3 deploying a fiber optic cable assembly into the wellbore, the fiber  
4 optic cable assembly including an anchor and a conduit for  
5 transmitting optical energy, the anchor configured to  
6 engage and disengage the wellbore to restrict or allow  
7 movement of the cable assembly therethrough;  
8 engaging the wellbore with the anchor at a desired depth of  
9 investigation;  
10 measuring the temperature along the length of the conduit; and  
11 disengaging the anchor from the wellbore.

1 42. The method of claim 41 further comprising mounting a spool to a  
2 wellhead of the wellbore.

1 43. The method of claim 42 further including using the spool to  
2 deploy and retract the fiber optic cable assembly to and from the  
3 wellbore.

1 44. The method of claim 43 further including enclosing the spool in a  
2 compartment, the compartment having an interior, the interior being in  
3 fluid communication with the wellbore.

1 45. The method of claim 44 further including isolating the spool, the  
2 fiber optic cable assembly, and the interior of the compartment from  
3 atmospheric conditions.

1 46. The method of claim 45 further including equalizing the pressure  
2 of the interior of the compartment with the pressure of the wellbore.

1 47. The method of claim 44 wherein the wellhead is a sub-sea  
2 wellhead.

1 48. The method of claim 41 further including activating the  
2 engagement of the anchor by transmitting optical energy through the  
3 conduit.

1 49. The method of claim 41 further including activating the  
2 engagement of the anchor by transmitting gas through a gas tube  
3 located in the fiber optic cable assembly.

1 50. The method of claim 41 further including activating and  
2 deactivating the engagement of the anchor by setting a timing device to  
3 engage and disengage the wellbore at specified time intervals.

1 51. The method of claim 41 further including activating the  
2 engagement of the anchor by transmitting a pressure signal in the  
3 wellbore that is received by a pressure transducer associated with the  
4 anchor.

1 52. The method of claim 41 further including activating the  
2 engagement of the anchor by elevating the pressure in the wellbore to  
3 rupture a first rupture disc associated with the anchor.

1 53. The method of claim 41 further including deactivating the  
2 engagement of the anchor by elevating the pressure in the wellbore to  
3 rupture a second rupture disc associated with the anchor.

1 54. The method of claim 41 further including activating the  
2 engagement of the anchor by engaging the anchor to a mechanical  
3 profile located within the wellbore.

1 55. A method to measure the temperature of a wellbore at multiple  
2 depths of investigation, the method comprising:  
3 attaching an anchor to a fiber optic cable;  
4 the anchor configured to engage and disengage the wellbore to  
5 restrict or allow movement of the cable therethrough;  
6 deploying the fiber optic cable down the wellbore;  
7 engaging the wellbore with the anchor at a desired depth of  
8 investigation;  
9 pulsing light at a fixed wavelength from the fiber optic cable;  
10 measuring back-scattered wavelengths of the pulsed light;  
11 analyzing the wavelengths to determine a temperature profile at  
12 the desired depth of investigation; and  
13 disengaging the anchor from the wellbore.

(54) Title: METHOD AND APPARATUS FOR DETERMINING THE TEMPERATURE OF SUBTERRANEAN WELLS USING  
FIBER OPTIC CABLE

(57) Abstract: Methods and apparatuses to determine the temperature profile of a wellbore using a fiber optic cable (40) and an anchor (50) are disclosed. Furthermore, a pressurized wellhead spool (100) that couples to a standard Christmas tree structure (10) on a well head to facilitate the injection of fiber optic cable (40) into an oil and gas well is disclosed. The wellhead spool (100) is portable and may be connected to fiber optic cable (40) already located at the site, for quick connection to on-site instrumentation. A method of using the apparatuses disclosed to measure wellbore temperature at multiple depths of investigation is also disclosed.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US02/27362

## A. CLASSIFICATION OF SUBJECT MATTER

IPC(7) : E21B 47/06, 19/08

US CL : 166/250.01, 66, 70, 77.1, 385

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 166/250.01, 66, 70, 77.1, 385, 384; 73/152.12, 152.18, 152.54

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	US 4,832,121 A (ANDERSON) 23 May 1989 (23/05/1989), see the entire patent.	1-55
A	US 2,677,427 A (McKINNEY et al) 04 May 1954 (04/05/1954), see Figure 1.	1-55

A	US 6,004,639 A (QUIGLEY et al) 21 December 1999 (21/12/1999), see the entire patent.	1-55
A	US A 6,268,911 A (TUBEL et al) 31 July 2001 (31/07/2001), see the entire patent.	1-55

☐ Further documents are listed in the continuation of Box C.

☐ See patent family annex.

\* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier application or patent published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family
